

## Astronomy

In this picture, it shows what an astronomer mainly does: dense and hard research from planets, to nebulae and everything in between. Astronomers spend days on end trying to figure out how the universe works, and how they can relate it to our own star and galaxy. They use complex computer science and calculations.

In this picture is an astronomer who is observing the night sky. Some astronomers actually have bases in Antarctica or Canada. They have these bases so that they can spend all day observing the stars because these locations are closer to the poles and have less daylight and more nighttime.
