

## Tools and Equipment for Occupational Therapy

Active Passive Trainers: Allows the clinician to completely control speed, resistance, number of rotations and load levels. They are engineered to improve blood circulation, strength, endurance and muscle tone.

Peg Test: The test involves two different abilities: movements of arms, hands, fingers, and fine motor skills, also called fingerprint dexterity.

Push Pull Dynamometer: Designed to measure strength of major muscle groups in the back, legs and chest.

Manual Muscle Tester: procedure for the evaluation of the function and strength of individual muscles and muscle groups based on the effective performance of a movement in relation to the forces of gravity and manual resistance.
