

## Kyle-Tools Sprinkler Fitters Use

### Pipe Wrench

A pipe wrench is one of the primary hand tools of a sprinkler fitter. This tool is used to pull together threaded pipe and fittings. They use this tool every day. The aluminum pipe wrenches are used more than the steel pipe wrenches due to the dramatic weight decrease in the tool.

### Power Threader

This tool is used very often when the guys get in a shipment of pipe that is threaded wrong or just won't fit. They put the pipe in this machine and it will clean up the threads.

## Level

The sprinkler fitters use this tool every single day they need to make sure the pipes are level and that things go together well. If this is not used, things could go very bad. For example, if a pipe is not lined up right, it could bust under the pressure of all the water going through it.
