

# Tools of a Computer Technician

By Ryan Cho

Screwdrivers; These are used to open up the computer's casing, as well as securing or removing components such as the motherboard and fans.

Flashlight: Used to look inside computer cases to help see smaller details and light up the dark insides

Crimp/Cut/Strip Tool: Used to repair or replace wires such as ethernet cables by removing insulation and granting access to the wire, as well as cutting the wire.

Needle-Nose Pliers: These are used as a multi purpose tool, such as removing screws from hard to reach places or prying off stubborn components

Flash Drives: These are used to carry around important files and diagnosing software that can help you determine what's wrong with a computer.
